Nipah virus (NiV) was first identified in 1998–1999 and remains a global public health threat due to its high fatality rate (40–75%), the absence of an approved vaccine, and the lack of specific treatment. Current management is limited to supportive care, making outbreak control particularly challenging.

In response to recent cases, HealthBridge is pleased to introduce the “**Nipah Virus Risk Prevention Companion**” service package, which includes:

- Health consultations with medical experts in Vietnam (expat support available)
- Telemedicine services across 40 countries
- Home-based ambulance support in Ho Chi Minh City
